Introduction to Psychology - James W. Kalat 2005

Jim Kalat's best-selling INTRODUCTION TO PSYCHOLOGY takes a "critical thinking" approach to the major theories and concerns of psychology. By prompting students to ask themselves questions like "How was this conclusion reached?" and "Does the evidence really support it?," Kalat encourages the use of scientific principles. Kalat's approach is proven to help students separate what merely sounds plausible from what is scientifically provable both in the psychology classroom and beyond it. With his humorous writing style and hands-on "Try It Yourself" exercises, Kalat puts students at ease and gets them involved with even with the most intimidating concepts. Within each chapter, he "chunks" the material into a modular format so that students can master one idea at a time, building confidence as they go. This format makes it convenient for instructors to assign material to match the way they teach the course. Kalat's supplements package includes substantial resources for professors and students alike. Food Aversion Learning - N. Milgram 2013-11-11

During the past 10 years, the study of learned aversions to foods has become one of the most 'popular' areas of research in animal psychology. Learned aversions to foods are typically produced in the laboratory by first allowing an animal to eat (or drink) some distinctively novel substance and then making the animal 'ill' in some way, most frequently by either giving it an injection of some "illness" -producing drug such as lithium chloride or by exposing it to a toxic dose of radiation. When an animal that has been treated in this way is subsequently given another opportunity to ingest the same or a similar substance, one usually observes that it will either totally avoid ingesting the substance or that it will consume less of it than a control animal that was not made ill after previously consuming the same substance. This form of learning has attracted the interest of many researchers because there are two apparently striking differences in the acquisition of food aversions and the acquisition of other types of associative learning.

Dictionary of Biological Psychology - Philip Winn 2003-09-02

Biological Psychology is the study of psychological processes in terms of biological functions. A major obstacle to understanding dialogue in the field has always been its terminology which is drawn from a variety of non-psychological sources such as clinical medicine, psychiatry and neuroscience, as well as specialist areas of psychology such as ethology, learning theory and psychophysics. For the first time, a distinguished international team of contributors has now drawn these terms together and defined them both in terms of their physical properties and their behavioural significance. The Dictionary of Biological Psychology will prove an invaluable source of reference for undergraduates in psychology wrestling with the fundamentals of brain physiology, anatomy and chemistry, as well as researchers and practitioners in the neurosciences, psychiatry and the professions allied to medicine. It is an essential resource both for teaching and for independent study, reliable for fact-checking and a solid starting point for wider exploration.
