Injury Research - Guohua Li 2012-01-06

Injury is recognized as a major public health issue worldwide. In most countries, injury is the leading cause of death and disability for children and young adults age 1 to 39 years. Each year in the United States, injury claims about 170,000 lives and results in over 30 million emergency room visits and 2.5 million hospitalizations. Injury is medically defined as organ/tissue damages inflicted upon oneself or by an external agent either accidentally or deliberately. Injury encompasses the undesirable consequences of a wide array of events, such as motor vehicle crashes, poisoning, burns, falls, and drowning, medical error, adverse effects of drugs, suicide and homicide. The past two decades have witnessed a remarkable growth in injury research, both in scope and in depth. To address the tremendous health burden of injury morbidity and mortality at the global level, the World Health Organization in 2000 created the Department of Injury and Violence Prevention, which has produced several influential reports on violence, traffic injury, and childhood injury. The biennial World Conference on

Injury Control and Safety Promotion attracts a large international audience and has been successfully convened nine times in different countries. In the United States, the National Center for Injury Prevention and Control became an independent program of the federal Centers for Disease Prevention and Control in 1997. Since then, each state health department has created an office in charge of injury prevention activities and over a dozen universities have established injury control research centers. This volume will fill an important gap in the scientific literature by providing a comprehensive and up-to-date reference resource to researchers, practitioners, and students working on different aspects of the injury problem and in different practice settings and academic fields.

Emergency Medical Services - Institute of Medicine 2007-06-03
Emergency Medical Services (EMS) is a critical component of our nation's emergency and trauma care system, providing response and medical transport to millions of sick and injured Americans each year. At its best, EMS is a crucial link to survival in the chain of care, but within the last several years, complex problems facing the emergency care system have emerged. Press coverage has highlighted instances of slow EMS response times, ambulance diversions, trauma center closures, and ground and air medical crashes. This heightened public awareness of

problems that have been building over time has underscored the need for a review of the U.S. emergency care system. Emergency Medical Services provides the first comprehensive study on this topic. This new book examines the operational structure of EMS by presenting an in-depth analysis of the current organization, delivery, and financing of these types of services and systems. By addressing its strengths, limitations, and future challenges this book draws upon a range of concerns: • The evolving role of EMS as an integral component of the overall health care system. • EMS system planning, preparedness, and coordination at the federal, state, and local levels. • EMS funding and infrastructure investments. • EMS workforce trends and professional education. • EMS research priorities and funding. Emergency Medical Services is one of three books in the Future of Emergency Care series. This book will be of particular interest to emergency care providers, professional organizations, and policy makers looking to address the deficiencies in emergency care systems.

Regionalizing Emergency Care - Institute of Medicine 2010-06-01
During medical emergencies, hospital staff and emergency medical services (EMS) providers, can face barriers in delivering the fastest and best possible care. Overcrowded emergency rooms cannot care for

patients as quickly as necessary, and some may divert ambulances and turn away new patients outright. In many states, ambulance staff lacks the means to determine which hospitals can provide the best care to a patient. Given this absence of knowledge, they bring patients to the closest hospital. In addition, because emergency service providers from different companies compete with each other for patients, and emergency care legislation varies from state to state, it is difficult to establish the necessary local, interstate, and national communication and collaboration to create a more efficient system. In 2006, the IOM recommended that the federal government implement a regionalized emergency care system to improve cooperation and overcome these challenges. In a regionalized system, local hospitals and EMS providers would coordinate their efforts so that patients would be brought to hospitals based on the hospitals' capacity and expertise to best meet patients' needs. In September 2009, three years after making these recommendations, the IOM held a workshop sponsored by the federal Emergency Care Coordination Center to assess the nation's progress toward regionalizing emergency care. The workshop brought together policymakers and stakeholders, including nurses, EMS personnel, hospital administrators, and others involved in emergency care. Participants identified successes and shortcomings in previous regionalization efforts; examined the many factors involved in successfully implementing regionalization; and discussed future challenges to regionalizing emergency care. This document summarizes the workshop.

Occupational Outlook Handbook - United States. Bureau of Labor Statistics 1976

Emergency Medical Systems - Zohra Jalal 2011-08-19

A formal training program with theoretical and practical components is essential for all emergency medical personnel involved in providing care for critically injured patients. Communication, effective first aid, and on time transportation to a health center play a major role in improving quality of care for critically injured patients. Using life experience examples, participants in the study emphasized the importance of each factor on the delivery of quality care for critically injured patients. Recommendations based on the study findings included two main categories. The first category illustrated recommendations to stakeholders, and the second category reflected recommendations for further study. Stakeholders in this study included healthcare leaders in Afghanistan, healthcare professionals involved in providing health care in Afghanistan, and local people in Afghanistan. The modified van Kaam method in the qualitative phenomenological study involved conducting semistructured interviews, which were audio-taped and transcribed. The rationale for using the phenomenological approach in the qualitative study was to describe in-depth experiences of health care professionals. Moustakas (1994) modified van Kaam method explored the lived experiences and perceptions of 17 doctors and nurses relating to emergency trauma care for critically injured patients. Data analysis revealed important factors that could enhance the quality of prehospital care for civilian casualties of landmine and unexploded ordnance (UXO) blast injuries in Afghanistan. The four major themes that emerged from participants responses to interview questions included communication, formal training for emergency medical personnel, transportation to a higher-level center, and quality of prehospital care.

Casualty Care for Fire and Rescue - Kris Lethbridge 2018-08-01

Casualty care and first aid is an integral part of the fire and rescue services' role and firefighters have always worked closely with pre-hospital medical providers in their aim to save lives. As the fire services are now increasingly involved in the delivery of medical care through co-responding schemes, casualty care and first aid training has become crucial for firefighters to provide initial assessment and care of patients when responding to a variety of medical emergencies. This textbook, written by an experienced team of firefighters and paramedics, is an essential guide to life saving care and has been specifically written for firefighters already employed or undertaking training within a fire and rescue service. Casualty Care for Fire and Rescue combines a skills-based practical approach with clinical knowledge and covers a range of urgent care that firefighters deliver and respond to, including trauma injuries, burns, road traffic collisions and cardiac arrest. The book is up to date with the latest policy and research, and addresses legal issues and clinical governance. A multi-disciplinary approach is taken throughout, and is explored in detail in a chapter on working with healthcare professionals. Chapters are also illustrated with photographs and anatomical diagrams to support understanding. Contents include: Working with Other Health Professionals; Communication; Clinical Governance, Legal and Ethical Issues; Safeguarding Adults and Children; Health and Safety; Manual Handling; Drug Administration; Scene Assessment; Patient Assessment; Airway; Breathing; Circulation; Disability; Exposure/Environment; Medical Emergencies; Trauma Emergencies; Cardiac Arrest; Children and Infants; Mental Health; Older People and Frailty
